Uncovering the Relationship Between Thermal Conductivity and Anharmonicity with Symbolic Regression (12 min talk + 3 min discussion)

Wednesday, 14 April 2021 17:30 (15 minutes)

Quantitatively understanding the link between anharmonicity and thermal conductivity, κ , is pivotal to the search for better thermal insulators. To help find this link we present new descriptors of κ based on our new measure of anharmonicity, σ^A . Using an updated sure-independence screening and sparsifying operator (SISSO) method, we find analytical expressions with symbolic regression and generate expressions for κ_L that are competitive with those previously reported in the literature using only a third of the primary features. Finally, we discuss the implications of the new models on future materials design.
